Details:

Many students mentioned in the Google group the validity of expression such as

i)   3+-4
ii) 3*-4

In my version of the calculator, I assume that these types of expressions are not valid. If the user wants to know the answer of the above expression, he/she should write them in the correct way. That is:

i)   -4+3
ii) -3*4

Also, we consider numbers such as .9 or 9. Invalid numbers. The user should enter: 0.9 or 9.0

My calculator shows error message if the user enters an invalid expression. For instance any of the cases mentioned above or expression with letters such as 3asds34.

Thank you..
